# Keyware (Buy- Under Review -)

Smart Cards-Security / Belgium

## ► Businesses & Trends

### Businesses & Trends

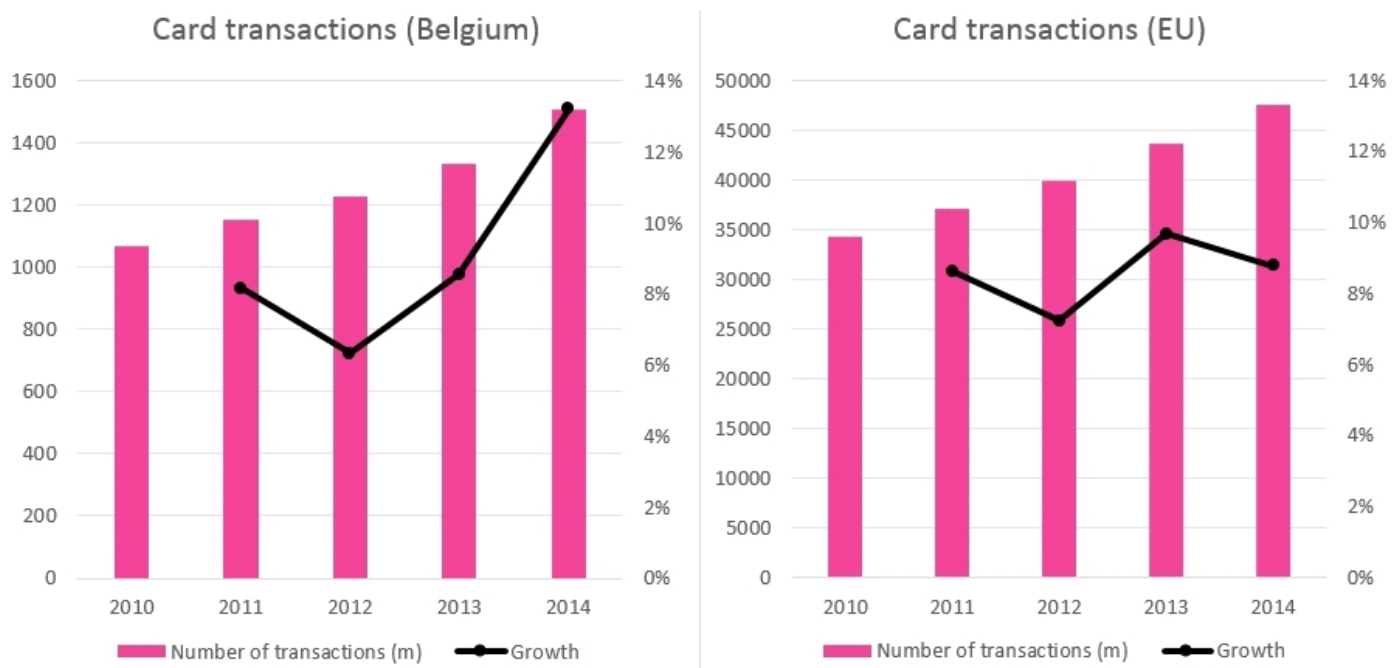

Keyware, created in 1996 and listed since 2000, is an independent Network Service Provider operating almost entirely in Belgium. The company provides payment terminals and associated services to merchants, as well as the implementation of various payment schemes through these terminals, thanks to partnerships with the main acquirers operating in the country (Paysquare, Sixpay, Worldline, EMS...).

#### The card payment market

Keyware can be considered as the tip of an iceberg, as it provides the entry point (namely the payment terminal) to a complex chain of players which constitutes, in the end, the ecosystem of the electronic transaction industry (a detailed explanation of the processing of an electronic transaction is provided in the Worth Knowing section of this report). The dynamism of this industry is a deep-rooted trend in the European Union and in particular Belgium (with the notable exception of Germany, which still favours cash transactions), as a certain number of factors are driving up the number of electronic transactions.

According to the ECB Payment Statistics report dated October 2015, in the period 2010-14, the number of non-cash transactions in the EU had a CAGR of 4.5%, reaching a number of 103.16bn transactions in 2014, while this CAGR was 9.5% in Belgium, reaching 3.44bn transactions in 2014. Of these electronic transactions and in the same period, the share of card payments increased in the EU by more than 6% to reach 46%, although this figure remained relatively stable in Belgium at 44%, where the population ranks no. 9 in the EU in terms of card transactions per capita.

As mentioned above, the increase in the number of card transactions is likely to be fuelled by a certain amount of drivers, amongst which we address: 1/ the rise of new types of payment solutions, such as smartphones and NFC (through electronic wallets like Apple Pay) or electronic meal vouchers, 2/ the dynamism of e-commerce (+14.3% in Europe in 2014), and 3/ the increasing restrictions on the use of cash in transactions as a way of fighting the shadow economy (€1,000 in France since 2015, €3,000 in Belgium since 2014). As a consequence, the increase in the number of non-cash transactions is expected to accelerate until the end of the decade, to reach 177bn in the EU in 2020 according to AT Kearney, with the share of card payments being at least stable when counting in the new payment methods.

#### The POS terminals market

# Keyware (Buy- Under Review -)

Smart Cards-Security / Belgium

## ► Businesses & Trends

The Point Of Sales (POS) terminals are the interface required to process electronic transactions: debit and credit cards, vouchers, coupons, smartphones...

The global market was valued at \$42bn in 2015 (according to Grand View Research), with important disparities: the demand for this type of terminal is very dynamic in America, but slowing down in APAC (notably because of China), while the European market is mostly saturated (2.3% CAGR for 2010-14). The underlying reason is mainly technological: the EU countries have been early adopters of the EMV standard, cryptographically secured, while the other parts of the world have mainly relied, until recently, on the flawed magnetic card technology, urging the need to upgrade their payment networks for better security. Once again Germany is an exception and could represent a market of 800,000 terminals in the years to come).

Contrary to the EU, Belgium remains a growth market for these terminals, with a CAGR of 7.3% for the period 2010-14. It had an installed base of 183k devices in 2014, and is behind when it comes to the number of terminals per inhabitants: 16.4k per million compared to 19.7k for the EU, leaving some potential for further growth.

Along with the increasing demand for card transactions which fuels this growth, as well as the renewal of the device at the end of its life, there are three other main drivers: 1/ the obsolescence of the terminal regarding security standards (called PCI-DSS), which are regularly upgraded, 2/ the rise of new technologies which leads to the upgrade, to accept new payment methods (NFC, vouchers...) or to integrate new functionalities (automated reporting, friendly interface, business apps...), and 3/ the introduction of new form factors, such as the mPOS, which brings more versatility by being able to function away from the merchant's traditional counter top.

### Business lines

Keyware operates two types of businesses: the payment terminals and the payment authorisations.

#### Payment terminals

This is the first of the two business lines operated by Keyware. The devices are sourced from the main suppliers of the market (mainly Ingenico and Worldline, and to a lesser extent Verifone) and then rented or sold to the company's customers.

The most common contract has a duration of 60 months (up from 48 months in previous years), with a rent for each quarter

## ► Businesses & Trends

which covers the operating and maintenance costs, while an installation fee is also charged. A customer can choose to upgrade to a newer terminal during the contract and, in this case, another 60 months contract is automatically signed in replacement of the previous one. At the end of the 60 months, the contract is automatically renewed if the customer doesn't give notice (as the life cycle of a terminal can reach 7-8 years), or the customer can choose to sign for another 60 months contract with a new device. If the customer chooses to terminate the contract before the end of the contract, a penalty is applied.

Keyware also proposes a customisation service, with the development of custom software addressing potential special needs of customers. This customisation provides an added value for the company, as it allows it to reach some customers which demand specific features in their terms of reference, but are left out by the devices provided by the original manufacturers as the latter tend to address mass volume generic markets. However, most of the related costs are bypassed by: 1/ not modifying the terminal source code too much, and 2/ by not supporting the certification costs (which represent a substantial part of the development costs of a terminal), which remain the responsibility of the original manufacturer.

Keyware provides three families of terminals:

- Fixed terminals, connected to the network via a cable and are usually found in shops, where customers pay at the counter.
- Portable terminals, composed of a base station connected to the network via a cable, and of a portable module communicating with the base station through a wireless connection, enabling a radius of up to 150m.
- Mobile terminals, connected to the network via a GSM or GPRS link, enabling a total autonomy within the country.

Keyware also provides payment modules addressing e-merchants, which allow payment on websites or through a smartphone.

### Payment authorisations

A terminal alone is merely a brick full of useless electronic components if they were not able to process the payment scheme and to connect to the financial institutions, which will *in fine* move the funds between the shopper and the merchant's accounts.

Keyware thus provides such services (for credit cards/debit cards and vouchers), sending the transaction details to the acquirer through the appropriate payment network, for authorisation and then settlement. The position of Independent Network Service Provider allows the company to propose the services of several partners, among which are: Visa, MasterCard, Maestro, V-Pay, Bancontact, JCB, Amex, Ingenico, Worldline, SixPay, PaySquare, EMS... giving its customers the greatest flexibility according to their needs.

For each transaction, the whole payment chain is remunerated through fees packaged into a so-called Merchant Service Charge, corresponding to a fraction of the transaction value, which varies depending on the use of the Keyware's platform or a partner's. Until recently, Keyware's share of revenues was determined according to a fixed percentage, limiting the upside potential; now, the company has started to shift towards a brokering model (expected to be fully achieved in 2018), whereby it buys the transaction from the acquirer at a floor price and sells it on to the customer at a discretionary price, thus leading to a substantial rise in revenues.

### **Customers & competitors**

The company's customers are mainly small merchants, with the exception of some official institutions. Only a fraction of corporate clients operate a significant number of terminals (60 to 70), for a share in the mix below 1,000 terminals out of the installed base of 17,000. A significant contract was signed in December 2015 to provide terminals to Charleroi Airport, foreshadowing a rise in the mix quality.

The company is also looking to expand its business beyond its borders: although France is a saturated market and sees the terminals market as being controlled by banks and original terminal makers, neighbouring countries offer much potential. As an example, the number of terminals per inhabitant in the Netherlands is 20% below the EU average, while this figure grows

# Keyware (Buy- Under Review -)

Smart Cards-Security / Belgium

## Businesses & Trends

to 49% in Germany, which could represent a market of 800,000 terminals.

In its existing market, Keyware is an outsider but it is steadily gaining market share with an installed basis of 17,000 terminals. The leader is Worldline, which operates more than 100,000 terminals. Another important player is CCV, with 38,000 terminals. Strangely, and despite much effort, Ingenico hasn't managed to grow its installed basis beyond 3,000 in five years, despite being a global leader in terminal manufacturing.

## Divisional Breakdown Of Revenues

	Sector	12/15A	12/16E	12/17E	12/18E	Change 16E/15		Change 17E/16E		
						€th	of % total	€th	of % total	
<b>Terminals</b>	Smart Cards-Security	11,562	12,827	14,238	15,804	1,265	22%	1,411	79%	
<b>Authorisations</b>	Smart Cards-Security	929	5,500 <sup>(1)</sup>	5,885 <sup>(1)</sup>	6,415 <sup>(1)</sup>	4,571	78%	385	21%	
<b>Corporate</b>	Smart Cards-Security									
Other										
<b>Total sales</b>		<b>12,491</b>	<b>18,327</b>	<b>20,123</b>	<b>22,219</b>	<b>5,836</b>	<b>100%</b>	<b>1,796</b>	<b>100%</b>	

1. Due to changes in accounting methods concerning commissions from authorisation agreements and to the application of the 2015 European Interchange Fee Regulation, the presentation of the gross sales and the associated cost of sales from the Authorisation business have been modified from 2016, while the operating profit remains identical.

## Key Exposures

	Revenues	Costs	Equity
Dollar	0.0%	0.0%	0.0%
Emerging currencies	0.0%	0.0%	0.0%
Long-term global warming	0.0%	0.0%	0.0%

## Sales By Geography

Belgium	97.0%
Netherlands	1.0%
Other	2.0%

We address exposures (eg. how much of the turnover is exposed to the \$ ) rather than sensitivities (say, how much a 5% move in the \$ affects the bottom line). This is to make comparisons easier and provides useful tools when extracting relevant data.

Actually, the subject is rather complex on the ground. The default position is one of an investor managing in €. An investor in £ will obviously not react to a £ based stock trading partly in € as would a € based investor. In addition, certain circumstances can prove difficult to unravel such as for eg. a € based investor confronted to a Swiss company reporting in \$ but with a quote in CHF... Sales exposure is probably straightforward but one has to be careful with deep cyclicals. Costs exposure is a bit less easy to determine (we do not allow for hedges as they can only be postponing the day of reckoning). How much of the equity is exposed to a given subject is rarely straightforward but can be quite telling. In addition, subjects are frequently intertwined. A \$ exposure may encompass all revenues in \$ pegged currencies and an emerging currency exposure is likely to include \$ pegged currencies as well.

Exposure to global warming issues is frequently indirect and may require to stretch a bit imagination.

## ► Money Making

### Money Making

Most of the cash generation obviously depends on the terminals business, which represents the majority of the revenues and the origin of the authorisations revenues, and is thus of vital importance for the company.

The first step to secure business was the extension of the contract life to 60 months, which leaves the customer captive to the company: if it wants to terminate the contract before its end, it must pay a termination fee to Keyware, currently €750, which is rather dissuasive considering that Keyware addresses small merchants which try to maintain their operating costs as low as possible, making a potential change to another provider highly unlikely.

Another source of cash is the silent renewal: if the customer doesn't show its intention to end the contract at the end of the 60 months, another year is automatically added on to the contract while the device remains the same, which generates highly profitable revenues for the company considering that a terminal life can reach seven to nine years without much maintenance.

One critical point for Keyware is its ability to create margin even though it doesn't design its own terminals, requiring the company to buy them on the market from players such as Ingenico or Worldline... which happen to be direct competitors. Three key drivers can be mentioned here:

- The quality of service, especially the hotline: considering the small size of the merchants Keyware addresses, even a small interruption in business due to a failure of the terminal can take on catastrophic proportions by blocking a substantial number of transactions and business opportunities. One strength of Keyware is to be very reactive and be able to confine problems to a very short time, justifying the premium by the quality of its service.
- Its proximity to the customer's needs, especially when it comes to the customisation of terminals. Indeed, the terminals provided by OEMs are generally addressed to global markets, with little differentiation, and can leave aside features crucial for some customers. Thanks to its custom solutions developed in-house, Keyware can propose to add exclusive features to standard terminals, hence justifying a premium by the importance given to them by the customer.
- The flexibility of its solutions: customers don't buy the terminals but rent them from Keyware, which gives the former the possibility of upgrading the machines at any time if they wish (through an extension of duration). The situation is similar in services, where its independent position means the company can deal with several acquirers, allowing it to propose tailored solutions to the merchants.

The quality of the customers is also of much importance as, according to IAS 17 rules, all the leasing contracts are recorded at the present value of the contracts (rental revenues) at a discount rate. The total amount is regularly adjusted for the difference with the actual revenues, which can be hampered by potential write-offs or bankruptcies, directly impacting the working capital. According to the company, 20% of the contracts witness mild delays, 5% require the intervention of a lawyer and 15% lead to a litigation, a rather high value that can be explained by the small size of the businesses Keyware addresses. A careful management of contracts and associated inventories (which quickly depreciate) is then crucial to increase cash generation.

Moreover, the company has suffered since 2005 from a financial agreement with PARFIP, in which it received a discounted sum of future rents while PARFIP collected the actual rental payments. In addition, the terminals saw their property officially transferred to Keyware, which thus supported all the risks associated. The contract officially ended in March 2015 by the acquisition of the park for €800k, which will mechanically boost margins.

Finally, the installed base of terminals will be leveraged in the Authorisations business, which provides acquiring services to the merchants. Here we see the biggest potential for operating profit upside, given the transition from a shared revenues model to a brokering model, whereby the company buys the transaction from the acquirer at a floor price and sells it on to the customer at a discretionary price, thus leading to a substantial rise in revenues for the same number of transactions. The end of the transition is expected by the end of 2018.

In addition, the company will see a mechanical increase in the number of transactions through its increasing installed basis of terminals. The challenge lies in the success of its own acquiring services, which generate higher margins compared to external providers such as EMS or Worldline. The trend is very positive, with own acquiring rising from 16.5% in 2010 to 77.1% in 2015.

## ▶ Debt

### Debt

Keyware's business model requires a considerable amount of capital, mostly due to the trade & receivables (corresponding to the lease contracts for the payment terminals) going up substantially as a direct consequence of the company's growth, implying strong WCR variations and therefore a negative cash outflow.

As a consequence, the company had to issue debt on a regular basis to preserve its liquidity. To date, c.35% is subscribed by private companies directly affiliated to management (Big Friend SA, Parana Management Corp SPRL and Iquess Consulting SPRL), the remainder being divided between bank loans and financial leases.

However, with the end of the PARFIP contract effective since 2015, the negative pressure on margins and WCR will be lifted, which should translate into a lesser cash outflow especially in lease contracts (the end of the PARFIP contract had a negative €800k impact in 2015, corresponding to the repurchase of the final contracts, see Money Making). Combined with the top-line growth and the margin improvement, the cash generation should enable the company to self-finance its business and lead to a quick deleveraging of the balance sheet, with a return to a net cash position expected during 2017 on our current estimates.

## ► Valuation

### Valuation

We have based our valuation on our own hypothesis, appearing rather conservative compared to that of the company, which forecasts a 16% top-line growth for 2016 and 2017 for an EBITDA reaching €7m in 2017.

The company benefits from a steadily growing installed terminals basis, which increased from c. 10,200 in 2010 to c. 16.950 in 2015, corresponding to a 10.7% CAGR over the period; as the company is gaining market share momentum (the 2010-14 CAGR in installed POS terminals in Belgium was 7.3%), which limits its ASP increase potential compared to bigger competitors, we chose to remain conservative and retain a similar growth rate for the terminals business line. We thus applied an 11% annual growth rate for 2016-18, as Belgium has yet to bridge the gap with the EU average when it comes to the number of terminals per inhabitant. However, some factors may well drive up this number (development of the electronic meal voucher, increasing restrictions on the maximum level of cash allowed in transactions, new markets addressable such as Germany), which would lead us to upgrade our estimates, while we see limited risk for downside with the exception of a potential air pocket.

For the authorisations, we chose to adopt the company's new presentation, that is to say the gross revenues adjusted for all the related costs, while the previous presentation only displayed the net commissions collected by Keyware; this change only impacts the revenues and the COGS/gross margin compared to the previous years, with the other metrics (such as EBIT) remaining unchanged.

The business witnessed strong growth rates in the past few years (CAGR of 50.86% for 2010-15), in the wake of a strong start (this business originates from the takeover of BRV Transactions in 2007) and of an increasing installed basis. While such growth rates can be explained by a low point of reference, and will inevitably normalise with time, some factors are likely to favour a strong growth, notably the transition from a traditional model of acquiring (shared revenues) towards a brokering model, which should lead revenues by transaction to increase threefold, although the transition will take some time because of the renewal of old contracts (c. 75% is still based on the shared revenues model), as well as the rise of the company's own acquiring. We thus chose to compute a progressive normalisation, with 2018 revenues (in comparable pre-2015 figures) reaching €1.67m.

These good perspectives translate into the DCF, with a computed long-term growth rate set at 4% for the revenues and EBITDA, which would lead to 2026 revenues of €30.4m. This is much reachable in our view given the good perspectives in Belgium, the growth opportunities in other markets (Germany) and the increase in revenues triggered by the transition towards a brokering model in authorisations. We also assume that there is little room for margin improvement, given the competitive landscape and the market share expansion strategy chosen by the company. However, the DCF could benefit from improvements in the WCR, currently strongly impacted by the massive needs in trades & receivables (including the recording of the long-term lease contracts as described in the Money Making section), while, on the other hand, it could suffer from an increase in the tax rate, which has been reined in upto now and shouldn't rise before 2018 thanks to the massive tax assets available.

Concerning the NAV, we chose to value Keyware the same way as we do for Ingenico, the business of which is very similar. As a consequence, we value the business lines by EV/Sales multiples with a computed 3-year average forecast, with a multiple of 3x for the Terminals business and 2.5x for the Authorisations, for which we applied a discount due to its inferior margins and dependence on terminal sales.

Coming to the peer valuation, we integrated companies in our coverage with a similar business (Ingenico) or sector (IT-Hardware), although apart from Ingenico the actual businesses are rather different. This approach delivers a strong upside in every metric, with the exception of the dividend yield, but given the difference in scale we chose to apply a 10% discount to Keyware.

► Worth Knowing

## Worth Knowing

---

### Players of the payment chain

Merchants: supply the goods and services in exchange of a payment, which can be cash or electronic, the latter requiring a payment terminal (or a gateway in the case of e-commerce). A merchant maximises its chances of concluding a transaction by accepting as many payment schemes as possible.

Payment acceptance processing providers: provide the merchants with the interface (POS terminals, online gateways) required to connect the card to the network and drive the transaction.

Acquirers: financial institutions which host the merchant accounts and give access to the desired card schemes (Visa, Mastercard...). They will also receive the funds (on which they will take a fee in exchange for the service provided) from the customers' banks once the transaction is completed.

Acceptance-related service providers: provide additional services to the merchants, such as coupons, loyalty, additional functionalities to the terminal, electronic meal vouchers...

Acquiring & issuing processors: provide payment transaction services to the acquirers and issuers through front-end (delivering payment clearances/refusals) and back-end (delivering gathered transaction approvals for settlement) processing.

Card schemes: players such as Visa, Mastercard... which operate their own networks with specific transaction rules.

Clearing and settlement institutes: correspond generally to national financial institutions, provide clearing and settlement of transactions between acquirers and issuers.

Issuers: provide the payment cards (which can use different schemes) used by the customers.

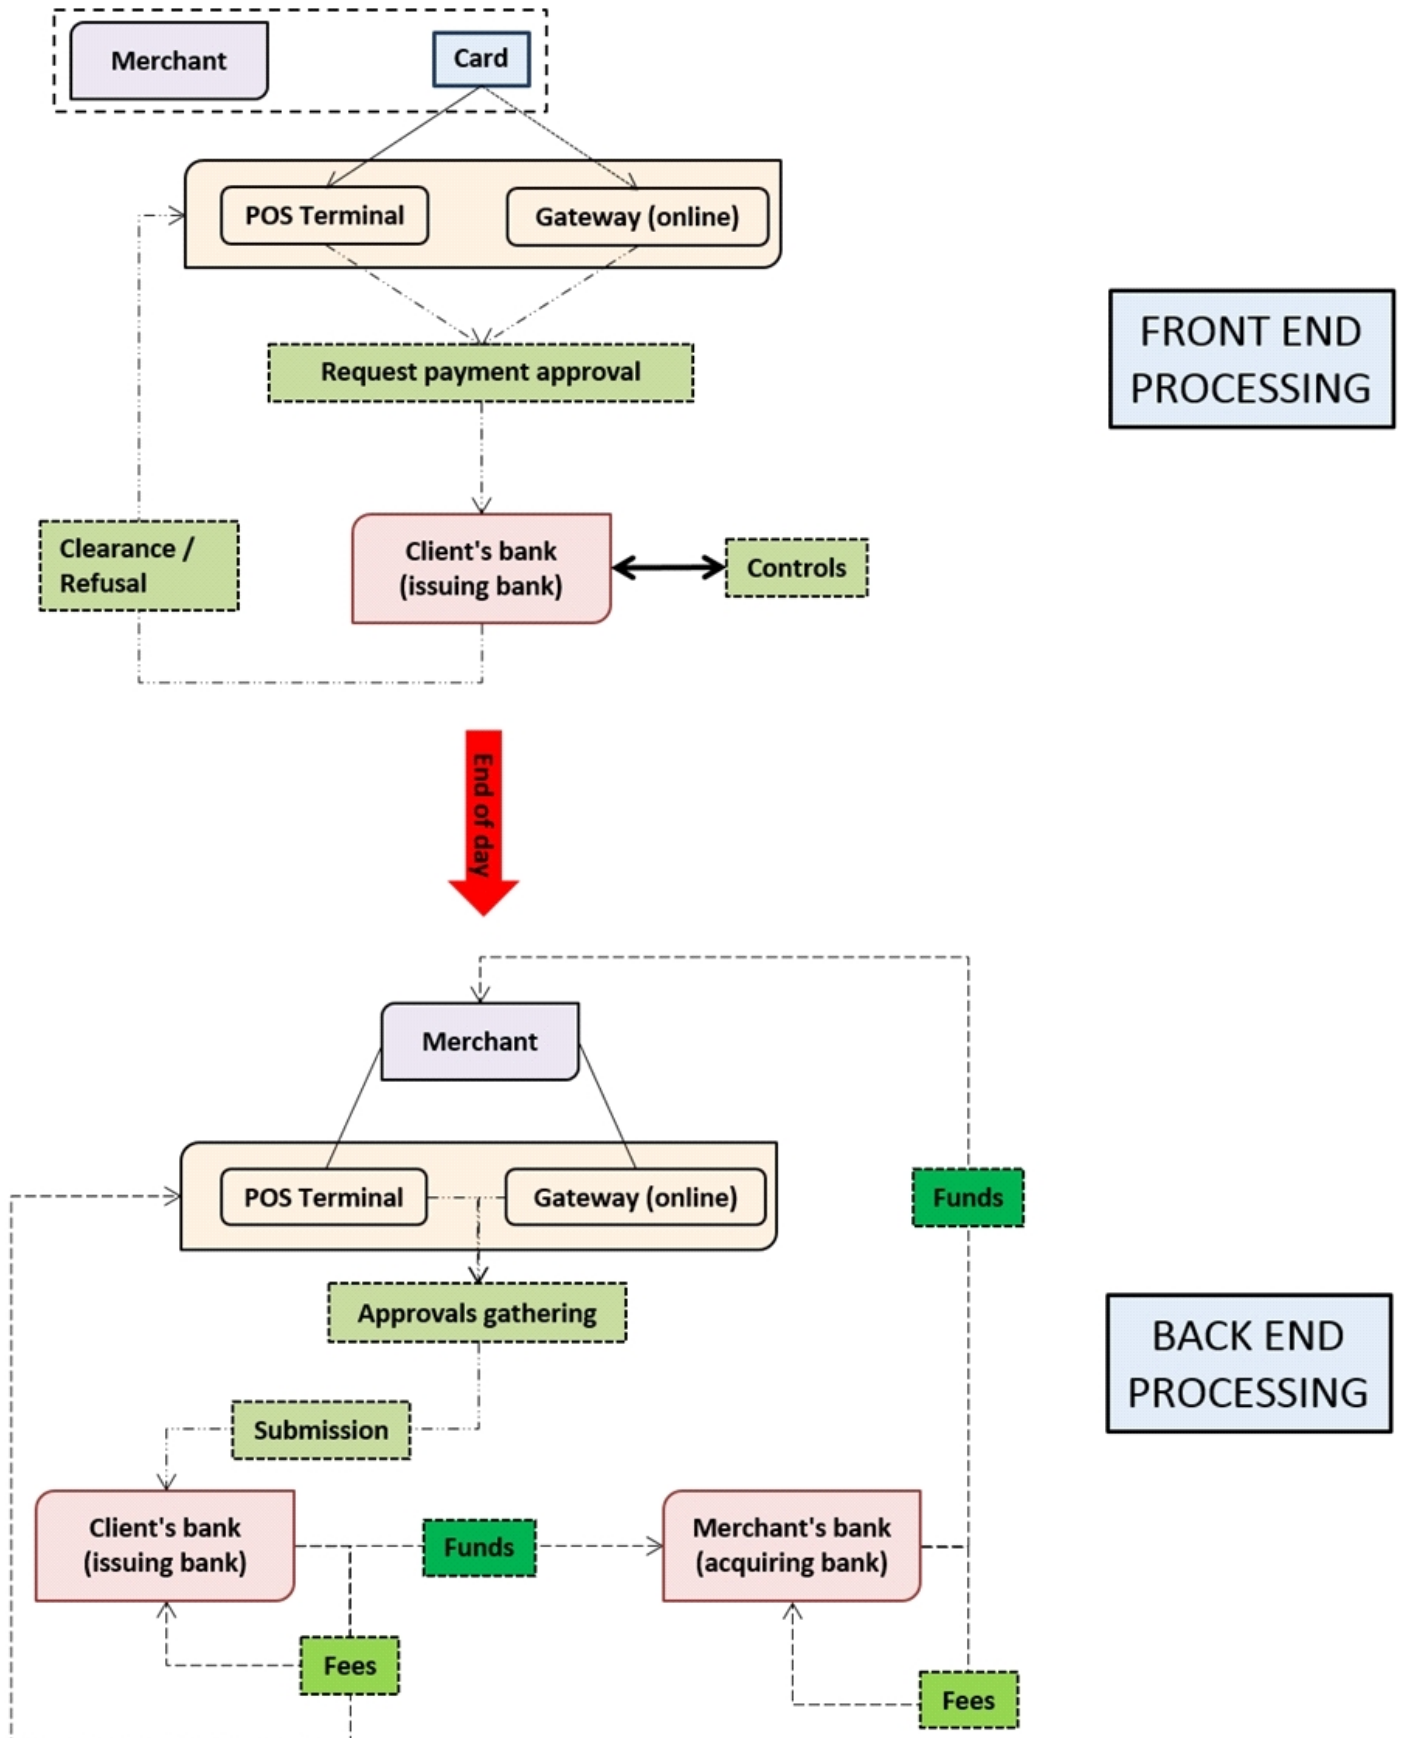

### Simplified example of the payment chain during a card transaction

## ► Worth Knowing

On 17 December 2012, a complaint report was drawn up against the subsidiary Keyware Smart Card Division NV concerning potential unfair market practices vis-à-vis other persons than consumers and fraud, possibly in violation of the law regarding market practices and consumer protection. While a judgment was expected by late 2015, new investigations have been required by the public prosecutor due to defect in the record, leading the management to be audited and the judgment decision to be delayed twice (it is now expected by late 2016). As a consequence, we consider that the risk is low for the company.

## ► Pension Risks

### Pension matters

The company had 37 employees at 31 December 2015, a figure relatively stable since the beginning of the decade. All employees are based in Belgium, hence the company doesn't hold any pension-related debt.

As the company doesn't develop its own terminals, the R&D can be considered as insignificant, especially as the development of custom software doesn't start from scratch nor goes too deep into the terminals' source code, and only requires two persons full-time, which allows the costs to remain low. As a consequence, most staff are administrative and sales personnel.

#### Summary Of Pension Risks

		12/15A	12/16E	12/17E	12/18E

### Momentum

 : Strong momentum corresponding to a continuous and overall positive moving average trend confirmed by volumes

 : Relatively good momentum corresponding to a positively-oriented moving average, but offset by an overbought pattern or lack of confirmation from volumes

 : Relatively unfavorable momentum with a neutral or negative moving average trend, but offset by an oversold pattern or lack of confirmation from volumes

 : Strongly negative momentum corresponding to a continuous and overall negative moving average trend confirmed by volumes

Momentum analysis consists in evaluating the stock market trend of a given financial instrument, based on the analysis of its trading flows.

The main indicators used in our momentum tool are simple moving averages over three time frames: short term (20 trading days), medium term (50 days) and long term (150 days). The positioning of these moving averages relative to each other gives us the direction of the flows over these time frames.

For example, if the short and medium-term moving averages are above the long-term moving average, this suggests an uptrend which will need to be confirmed. Attention is also paid to the latest stock price relative to the three moving averages (advance indicator) as well as to the trend in these three moving averages - downtrend, neutral, uptrend - which is more of a lagging indicator.

The trend indications derived from the flows through moving averages and stock prices must be confirmed against trading volumes in order to confirm the signal. This is provided by a calculation based on the average increase in volumes over ten weeks together with a buy/sell volume ratio.

# Methodology

# Keyware (Buy- Under Review -)

Smart Cards-Security / Belgium

## ► Methodology

### Fundamental Opinion

It is implicit that recommendations are made in good faith but should not be regarded as the sole source of advice.

Recommendations are geared to a "value" approach.

Valuations are computed from the point of view of a **secondary market minority holder** looking at a medium term (say 6 months) performance.

Valuation tools are built around the concepts of **transparency**, all underlying figures are accessible, and **consistency**, same methodology whichever the stock, allowing for differences in nature between financial and non financial stocks. A stock with a target price below its current price should not and will not be regarded as an Add or a Buy.

Recommendations are based on target prices with no allowance for dividend returns. The thresholds for the four recommendation levels may change from time to time depending on market conditions. Thresholds are defined as follows, ASSUMING long risk free rates remain in the 2-5% region.

Recommendation	Low Volatility (10-30)	Normal Volatility (15-35)	High Volatility (above 35)
Buy ●	More than 15% upside	More than 20% upside	More than 30% upside
Add ■	From 5% to 15%	From 5% to 20%	From 10% to 30%
Reduce ■	From -10% to 5%	From -10% to 5%	From -10% to 10%
Sell ●	Below -10%	Below -10%	Below -10%

There is deliberately no "neutral" recommendation. The principle is that there is no point investing in equities if the return is not at least the risk free rate (and the dividend yield which again is not allowed for).

Although recommendations are automated (a function of the target price whenever a new equity research report is released), the management of AlphaValue intends to maintain global consistency within its universe coverage and may, from time to time, decide to change global parameters which may affect the level of recommendation definitions and /or the distribution of recommendations within the four levels above. For instance, lowering the risk premium in a gloomy context may increase the proportion of positive recommendations.

### Valuation

Valuation processes have been organized around transparency and consistency as primary objectives.

Stocks belong to different categories that recognise their main operating features : Banks, Insurers and Non Financials.

Within those three universes, the valuation techniques are the same and in relation to the financial data available.

The weighting given to individual valuation techniques is managed centrally and may be changed from time to time. As a rule, all stocks of a similar profile are valued using equivalent weighting of the various valuation techniques. This is for obvious consistency reasons.

Within the very large universe of Non Financials, there are in effect 4 sub-categories of weightings to cater for subsets: 1) 'Mainstream' stocks; 2) 'Holding companies' where the stress is on NAV measures; 3) 'Growth' companies where the stress is on peer based valuations; 4) 'Loss making sectors' where peers review is essentially pointing nowhere (ex: Bio techs). The bulk of the valuation is then built on DCF and NAV, in effect pushing back the time horizon.

Valuation Issue	Normal industrials	Growth industrials	Holding company	Loss runners	Bank	Insurers
DCF	35%	35%	10%	40%	0%	0%
NAV	20%	20%	55%	40%	25%	15%
PE	10%	10%	10%	5%	10%	20%
