

(PB3862) SAFETY AND EFFICACY OF GOLIDOCITINIB IN COMBINATION WITH AZACITIDINE AND CHIDAMIDE FOR THE TREATMENT OF PERIPHERAL T-CELL LYMPHOMA: AN OPEN-LABEL, SINGLE-ARM STUDY

Topic: 20. Other aggressive lymphomas

Background

Peripheral T-cell lymphomas (PTCL) are aggressive non-Hodgkin lymphomas with poor outcomes. Traditional frontline therapy, such as anthracycline-based chemotherapy, offers limited clinical benefit, particularly in elderly patients or those with severe comorbidities. Golidocitinib, a selective oral JAK1 inhibitor, has shown reasonable antitumor activity with manageable safety in relapsed/refractory PTCL. Hypomethylating agents (azacitidine) and HDAC inhibitors (chidamide) also demonstrate clinical activity in practice. Preclinical studies indicated synergistic effects of the triplet combination, providing a rationale for a chemo-free approach in these frail patients.

Aims

To evaluate the safety and efficacy of golidocitinib in combination with azacytidine and chidamide in patients with PTCL who are ineligible for standard chemotherapy or transplantation.

Methods

Phase 1 employed a 3+3 dose-escalation design, exploring golidocitinib at two dose levels of 150 mg QOD or 150 mg QD to determine the RP2D. Phase 2 explored the safety and efficacy of golidocitinib RP2D in combination with chidamide 20mg twice a week and azacytidine 100mg D1-7 in PTCL. The primary endpoint was overall response rate (ORR) after at least 6 cycles according to 2024 Lugano criteria (NCT07081607).

Results

Between Aug 1, 2025, and Feb 28, 2026, 11 patients, including 10 nodal T follicular helper cell lymphoma, angioimmunoblastic type (nTFHL-AI) and 1 PTCL-NOS, were enrolled in the study. Of the 11 patients, 9 patients were newly diagnosed and 2 in relapsed disease. The median age was 74 years (range, 68-84); 8 patients (72.7%) were male. 8 patients (72.7%) were in Lugano stage IV disease, 6 (54.5%) had ECOG performance status ≥ 2 , and 9 (81.8%) with an international prognostic index (IPI) score ≥ 3 . Among the 11 patients, 10 had the following comorbidities at baseline, considered ineligible for intensive treatment, including 7 with cardiovascular comorbidities (2 with arrhythmia and 5 with coronary heart disease), 2 with renal insufficiency, and 1 with cachexia. At data cutoff (Feb 28, 2026), with a median follow-up of 7.1 months, eight patients were evaluable for response assessment. Four patients achieved complete response (CR), with three partial response (PR) and one stable disease (SD), yielding an ORR of 87.5% (7/8) and a CR rate of 50% (4/8) after 3 cycles. Among the four patients who completed end-of-treatment assessment (6 cycles), two achieved CR (50%), and two had progressive disease (PD).

The most common grade ≥ 3 treatment-related adverse events were hematologic toxicities, consisting of 4 (36.4%) grade 3 leukopenia, 4 (36.4%) grade 3-4 thrombocytopenia, and 2 (18.2%) anemia. Grade 3 pulmonary infection and grade 3 gastrointestinal bleeding were separately observed in one patient (9.1%). Grade 1-2 cytomegalovirus infection occurred in six patients (54.5%) and resolved with antiviral therapy.

Summary/Conclusion

Golidocitinib combined with azacitidine and chidamide showed encouraging efficacy with manageable toxicity in frail PTCL patients. These preliminary results support further evaluation of this chemo-free regimen in this population.
