1 Overview

1.1 Range of functions of the Alpin | Thumbnail app for d.velop documents

The "Alpin | Thumbnail App for d.velop documents" by Alpin offers the possibility to display images and documents as thumbnails in a digital light table function within the d.velop cloud platform. In addition, the properties of the images can be displayed - provided that they have been saved in the image by the recording device within the frame of the recording of the respective image. Through integration in Google Maps (©), the geographical location of the image recording can be visualised directly in Google Maps (©).

1.2 Integratability

For details on integration - see service description of d.velop cloud platform.

1.3 Rights to contents

You grant us a simple right of use, limited in time and place to the purposes of cloud operation, to all content that is imported or created by you or your employees in the d.velop cloud. All rights of exploitation, modification, etc. naturally remain with you, provided that you hold them.

2 Administration

2.1 Support

Details on the support of the d.velop cloud platform - see service description of d.velop cloud platform. Details on support for this app - see Service Level Agreement of Alpin GmbH.

2.2 Backup and disaster recovery

Details on backup and disaster recovery - see service description of d.velop cloud platform.

2.3 Data deletion

Details on data deletion - see service description of d.velop cloud platform.

3 Information security

3.1 Data location

Details on the data location - see service description of d.velop cloud platform.

3.2 Encryption of contents ("data at rest")

Details on the encryption of content - see service description of d.velop cloud platform.

3.3 Transport encryption ("data in transit")

Details on transport encryption - see service description of d.velop cloud platform.

3.4 Isolation of apps

Each app is technically strictly isolated from other apps, so that it is not possible for the apps to independently access data from other apps. If an app needs to access the data of another app, this takes place via HTTPS via defined interfaces in compliance with the authorisations of the calling user. Further details on the isolation of apps - see service description of d.velop cloud platform.
