Product Description
d.velop cloud migration toolkit

1 Overview

In addition to the "Product Description d.velop cloud platform," the specific functionalities of the d.velop cloud migration toolkit are described below.

A description of the support services, availability and update procedure for the d.velop cloud migration toolkit can be found in the "Service Level Agreement Cloud and SaaS."

2 Description

The d.velop cloud migration toolkit is the primary means of evaluating a source system and carrying out a cloud migration using this source system. By simply uploading a repository configuration, it is possible to carry out an automatic analysis to determine suitability for mapping in d.velop documents cloud. The report generated provides information about possible functional differences and shows alternative mapping options for special configurations in the source system. It is currently possible to analyze datasets, properties and categories.

The automatic migration of the repository configuration enables a simple transfer to a cloud target system. In addition, DMS assignments can be created for individual migrations.

The d.velop cloud migration toolkit offers migration partners interfaces that provide information about configurations of the source system and support the migration of documents from the source system to the target system. For example, categories, properties, users and groups can be queried.

In addition, the migration interface for a document migration can be activated and authorized with the help of the d.velop cloud migration toolkit.
