Product Description
d.velop collaboration

1 Overview

In addition to the "Service Description d.velop cloud platform," the following outlines the product-specific functionalities of d.velop collaboration.

Support, availability, and updates for d.velop collaboration are described in the "Service Level Agreement".

2 Scope of functions

d.velop collaboration is intended for customers who want to share documents from d.velop documents with individuals inside and outside their organization.

It offers the ability to share documents and links to documents and files via email directly from d.velop documents, or to provide documents in a d.velop cloud storage, making them accessible via an external link.

2.1 Sharing Files as E-mail Attachments

The customer can select up to 20 documents. The service generates an EML file that contains the respective document links in the email body.

This EML file is made available for download and can be processed further using a local email client. To access a link, the user must be able to establish an HTTPS connection to d.velop documents, be a valid user, and have at least read access to the target object of the link.

2.2 Sharing Internal Links that Point to Documents by E-mail

The user can select up to 20 documents. The service generates an EML file that contains the links to the documents in the message body. You can download the EML file and then process it further using a local mail client.

To open a link, the recipient must be able to establish an https connection to d.velop documents and be a valid user. The user must also have at least read permission for the linked object.

2.3 Sharing Files Using Links that Point to d.velop cloud storage

The customer can select one or more documents, which are then copied to the d.velop cloud storage. The total file size must not exceed 200 MB. A link to the file in the cloud storage is provided, which can be shared via email, for example.

The customer can define how long the copy should be retained in the cloud storage (maximum: 180 days). It can also be specified whether the person accessing the link is allowed to upload a new version. This new version can then be transferred from the cloud storage back into the d.velop documents system as a new version. The person accessing the link does not require special permissions to download the file from the cloud storage.

2.4 Requirements

A d.velop documents (On Premises) environment must be operated in hybrid mode to use the feature "Sharing files via link to d.velop cloud storage."

Information and requirements for this can be found here: product page for d.velop platform connect.
